

Digital public infrastructure
is only as good as the
protection around it.

Introducing **Digital Trust Futures Foundation** — an independent, non-profit public-benefit organisation for the digital systems people cannot opt out of.

— THE STAKES

These are no longer
government IT projects.
They are how life works.

Identity, payments, health, social protection and data exchange now decide whether a person can prove who they are, get paid, get treated or get help.

When systems like these fail, the blast radius is not a customer base. **It is a population.**

- 
- Digital identity
 - Payments
 - Health
 - Social protection
 - Data exchange
 - Public-service AI

— THE GAP

The people who build these systems are often the same people certifying that they are safe.

Vendors, implementers and platforms have real expertise. They also have something to sell. Assurance from a party with a commercial stake in the answer is not assurance — it is marketing with a methodology section.

Countries deploying digital public infrastructure need a second opinion that **nobody profits from**.

WHO WE ARE

An independent, non-profit
public-benefit foundation.

We work on the safety, security, rights and trustworthiness of digital public infrastructure, digital public goods, open-source technology and AI-enabled public services.

ESTABLISHED

2026

REGISTERED

Non-profit company, South Africa

WHERE WE WORK

Africa and the Global South

MANDATE

Public interest, not commercial

— HOW WE WORK · FIVE DIVISIONS

Assurance, code, evidence —

- 01

DPI Security, Safety and Trust Lab

Independent safeguards assurance for the systems that hold identity, money and entitlement.
- 02

Open Digital Commons and Software Trust

Securing and sustaining the open-source code that public services quietly run on.
- 03

Digital Trust Policy and Evidence Centre

Research that turns technical risk into evidence policymakers can act on.

— HOW WE WORK · FIVE DIVISIONS

— capability, and a safety net.

04

Digital Trust Skills and Implementation Academy

Building local capability with teams, rather than building their dependency on us.

05

Public-Interest Cyber and Digital Safety Centre

Cyber support for civil society, defenders and journalists who cannot buy it commercially.

APPLIED ACROSS ALL FIVE

- Human rights
- Children & young people
- Civil society

These are operating lenses, not an appendix. Every assessment asks who carries the risk — and whether they can get a remedy when it goes wrong.

— TWO COMMITMENTS, STATED ON DAY ONE

How we intend to behave.

Independent by design

We operate outside vendor, implementer and platform incentives. We do not sell the systems we assess, and we will say so plainly when something is not safe.

Open by default

Our tools, research and frameworks are released as public goods under an open licence. Fund the work once, and every country facing the same risk can use it.

— ONE HONEST THING

We are new.

We have a mandate, a method, and people who have spent careers on this. What we do not have yet is a track record. **That gets built in public, starting now.**
